ABC COLLEGE OF ENGINEERING

Kozhikode, Kerala – 673601

EXAMINATION ANSWER PAPER

Department	:	ARTIFICIAL INTELLIGENCE AND DATA SCIENCE
Subject	:	EIA
Course Code	:	AIT401
Student Name	:	NIHARIKA RANJITH
Register No.	:	VML23AD075
Roll No.	:	9169
Semester	:	
Examination	:	FN / AN / NN
Date	:	

2] In environmental impact assessment the public participation plays a major role because while designing a project, it can cause harm to human beings in many ways. People can lose their land, property, habitat etc. It can even cause harm to their health issues due to air pollution, water pollution, noise pollution etc. It can cause harm to the biodiversity. The public participation is important because the publics can express their opinion and tell their concerns. Then, the project can be done by meeting the needs of the people.

3] Noise pollution is a type of pollution that occurs thro noise. That is, it can be from the noise of horns of vehicles, machinery noises, noise of vehicles etc. These noises can effect the ears of living human beings which can lead to becoming deaf. It can also effect the ecosystem by disturbing the environment using excessiv noises. Using horns while necessary reduces the impact of noise pollution. Also reduce the use of machines that

produce large noises.

4] i) Impact prediction refers to the process of identifying the severity or extend of the impact. After identifying the the impact as positive or negative we perform the impact prediction which helps to understand the severity and take precautions according to it.

ii). Socio economic impact refers to the impact that causes harm to the social and economic part which includes society, human beings, peoples, economic etc. This can be reduced by taking safety measures like rehabilation, or following the rules and laws of the environment.

5] The two impacts on the water environment due to any solid waste management project include :-

* Underground water - Occurs when the waste materials degrade to the ground, the chemicals contained in it gets dissolved with underground water which can cause health issues and other harms.

mitigation measures - Use proper waste management plans
and ensure safe disposal.

* Surface water - Since the waste materials are heavy
do the water bodies like river, ponds etc.
the chemicals in the waste get dissolved
in the water which also leads to many
health issues as well as other harms.

mitigation measures - Avoid throwing waste to the side of
river bodies like river, ponds, lakes and
make use of waste bins and other waste
management plans.

6] Impacts caused due to quarry mining project include :

* Noise pollution - Blasting, drilling etc can make large
noises causing harm to people as well as
workers. Heavy noise of machinery can also
cause harm.

* Air pllution - While drilling, blasting chemical the air g
polluted by dust particles and cause harm
to people nearby as well as workers.

* Water pollution - The underground water can be affected by drilling for doing quarry mining process.

* Loss of plantation - Plants and trees are removed from the places which can cause huge amount of damage to the ecosystem.

11] Lets consider the discurrent highway widening project in Kerala which NH66.

* Objectives :-
  - Traffic reduction
  - Easy transportation
  - Less noise pollution
  - Less wasting wasting of time
  - Reduce air pollution

* Baseline study

Collects all the details about the current status of air, water, noise and other data. to study the land and design the project according to that.

* Impact identification

Identify the positive and negative impacts that occur while the building of project.

- Reduce the effect of using drums unnecessarily.
- Avoid causing air pollution during construction which can cause respiratory problems

* Public participation

Communicate with the public and understand their concerns. Ask them what are the issues they face and take measures according to that.

* EIA report

Prepare an EIA report which contains the details of the project

* Complaince with laws

The project must be done by forming complaince with environmental laws and rules.

§

* Continous monitoring

The project should be monitored continously untill the project is completed. Each changes should be recorded and updated. Required safety measures should be taken for workers as well as for the environment.

Positive impact can include bright weather, value of
air pollution, low noise pollution, easy transportation etc

Negative impact can include loss of plantation due to
cutting down trees and plants, loss of habitat of
human being as well as other living organism, loss
of land etc

* Impact prediction

Identify the severity and extend of the impact so that
the project can be build by considering the impacts
and take precaution or redesign the project

* Impact evaluation

Identify the impact and evaluate the impact and check
the how much useful and loss them it is

* Mitigation measures

Take the corresponding mitigation measures to reduce the
negative impact and during build the project.

It includes :-

- planting trees on both sides to not to disturb the
  ecosystem for cutting trees.
- the Rehabilate people to safer places.

7a] * EIA helps to identify the impact of the environment

* It helps to provide sustainable development.

* Promote the compliance with environmental laws and rules.

* Protect the plants and animals.

* Protect the biodiversity and ecosystem.

* Helps to identify impact and take precautions.

* Helps to take correct mitigation measures.

* Helps to identify the impact and redesign the project

* Helps to make better plan or decision on a project.
